Project description

Growplify is a mobile application that uses AI to analyse company financial data and show if employees, teams and projects are generating profit or not. It creates financial reports and helps the user plan project outcomes based on different investment scenarios.

The project features the following main functionalities:

- Individual and team profitability analysis
- Profit forecasting and investment simulation
- Smart notifications

Phase I - User and Task Analysis

At this stage, we realize the importance of collecting as much data as possible about the target users. This allowed us to select features that would truly make a difference in strategic decision-making within a company's financial context.

Through this method of data analysis and processing, it was possible to develop theoretical foundations to aid in the implementation of the next phase.

Phase II - Lo-fi prototype and heuristic evaluation

After the initial development of the interface, materializing the ideas from the previous phase in a low-fidelity prototype and subsequently subjecting it to a heuristic evaluation, it was possible to highlight some usability problems.

In this way, our group was able to optimize visual aspects of the prototype, present data in more detail, and add help pages, with the objective to support users.

Sample characterization

The sample of users who participated in the evaluation is representative of potential users of our application. Ten participants were selected who hold management positions in companies or who are in the initial stages of creating a company, with ages ranging from 23 to 51.

All of them agreed to participate voluntarily, and we asked them to be honest with their evaluation.

User evaluation

Initially, a brief presentation of the application's objective and context was given, followed by a demonstration of the help page to illustrate the main functionalities.

Next, users were asked to perform three specific tasks. Starting from the main page, participants had to access a team page, access a project page and interact with the sliders, and check notifications. Performance evaluation was based on the time required to complete each task, the number of clicks made and the number of errors, considered as unnecessary clicks during task execution.

After completing the tasks, users were asked about their satisfaction with each task, in order to express their opinion regarding the complexity, intuitiveness, visual presentation, and relevance of the functionalities to the application.

Access the Website Development project, change two fields and get the forecast.

User	Time in seconds	Total number of clicks	Number of errors
1	42.3	7	2
2	28.1	5	0
3	56.7	9	4
4	37.5	6	1
5	45.9	8	3
6	31.2	5	0
7	62.4	10	5
8	33.8	6	1
9	49.1	8	3
10	26.5	5	0

Total time:

- Mean: 41.35 seconds
- Expected value: 50 seconds
- Confidence interval: [32.82 , 49.88]
- We can infer that the time to conclude the task is less than 50 seconds, with 95% confidence.

Total number of clicks:

- Mean: 6.9
- Expected value: 8
- Confidence interval: [5.62 , 8.18]
- We can't infer that the number of clicks to conclude the task is less than 8, with 95% confidence.

Number of errors:

- Mean: 1.9
- Expected value: 3
- Confidence interval: [0.62 , 3.18]
- We can't infer that the number of errors to conclude the task is less than 3, with 95% confidence.

Qualitative Analysis:

- Medium complexity, intermediate intuitiveness, good visual presentation and very relevant to the application.

Access the marketing team page

- Average time of 20.26 seconds, average number of clicks is 2.4 and average number of errors is 0.4.
- A very simple task, very intuitive, with a very good visual presentation and very relevant to the application.

Open the notifications page and delete the first one that appears

- Average time of 9.37 seconds, average number of clicks is 2.1 and average number of errors is 0.1.
- A very simple task, very intuitive, with a very good visual presentation and relevant to the application.

The results obtained in these two tasks were much closer to the expected values, which is understandable given the lower complexity.
