Phase I - User and Task Analysis

Project Description

Growplify is a mobile application developed with the objective of helping companies identify if projects, teams or partnerships are generating profit or not. With the use of artificial intelligence, the app can generate detailed financial reports, which can help to establish a connection between productivity metrics with profitability indicators, in a way to help users identify where efficiency improvements or cost reductions can redirect to higher margins.

The platform supports scenario modeling to assist in strategic decision-making. In other words, by manipulating different parameters of a given project, such as the number of employees and work hours per week, managers can see what the expected results are and make decisions to increase profitability.

Growplify also has features that evaluate the financial performance of partnerships, analysing each collaboration through its profit and rentability helping users to identify which can be harmful or not to the company.

Ultimately, Growplify allows companies to create value from financial data, ensuring that every operational decision and investment is used in a way to increase the value of the company.

Related apps/services/systems

App/Service/System	Similarity
Datarails FP&A Genius	Focus on linking operational metrics to profit indicators and supporting strategic decisions.
Planful Predict	It helps managers test different parameters and see how they affect profitability.
Domo.AI	It allows you to identify where efficiencies or costs can be adjusted to increase margins.

Table 1 - Related apps/services/systems

Questionnaire highlights

How do you prefer to view the data?

- Numeric/raw values
- Graphics and visual presentation
- Both

How important would it be for you to be able to monitor employee performance clearly and quickly?

- Nothing important
- Little important
- Moderately important
- Important
- Very important

How often would you like to receive reports on employee productivity?

- Never
- Daily
- Weekly
- Monthly

What would be your biggest concerns when using an application like this?

- Privacy and security
- Complexity of use
- Costs
- Reliability of analysis

*These are just some of the questions we chose

Questionnaire Highlights – Justification

Who

The main target of the questionnaire were people who are responsible for analyzing financial data and making strategic decisions based on that. These users include company directors and executives, operations managers, team leaders, project managers and HR managers.

By analyzing the data from the questionnaire answers, we ensure that the application's features align with the expectations and interests of the target users.

How

The main collection method was Google Form, which is an online survey form that ensures quick and anonymous participation. The questionnaire was distributed through multiple communication channels such as email invitations, LinkedIn, and company Slack/Teams groups

How Many

- A total of 18 responses were received.
- All participants hold decision-making or supervisory roles in companies or business, including directors, operations managers, and team leaders, ensuring a highly relevant sample for Growplify's target audience.
- Responses cover different sectors (finance, consulting, technology, and logistics), providing sufficient diversity of management experiences and financial decision-making needs.

Each participant has experience in monitoring and analyzing data in a financial context, which provides reliable insights for defining the app's features, dashboards, and priorities.

Why This Matters

- Confirms that data visualization and usability are top priorities for the target users.
- Validates the need for frequent, clear, and secure reporting, directly informing the design of the dashboard and notification features.
- These results support persona development and PACT analysis, ensuring that the design of Growplify aligns with real managerial workflows and strategic decision-making processes.

PACT Analysis

People

The primary users are company directors, operations managers, and team leaders, responsible for analyzing data in financial context and making strategic-decisions from that. These users require detailed reports and tools to simulate scenarios, and assess the financial value of teams, projects and partnerships.

Activities

Growplify allows managers to analyze employee profitability reports. The app uses AI analytics to help companies understand which fields or areas can be changed to increase profit, through different investment scenarios.

Context

The mobile app was developed for both remote and in-person work, so that managers and senior executives in operational, project, and HR roles can ensure accessibility and continuity in monitoring financial performance. Available on mobile and web platforms, Growplify provides real-time insights that aid in data-driven decision-making.

Technologies

Growplify was developed as a mobile and web application with interactive dashboards and a centralized cloud database. It integrates AI analytics and financial modeling so that users can act quickly to operational changes, improving profitability and preventing negative impacts.

Personas

Persona 1

Name	Helena Duarte
Age	43
Education level	Masters in Business Administration
Occupation	Director of Operations
Family	Married, two children
Location	Porto, Portugal
Technological proficiency	Above average
Preferred devices	Laptop at work, tablet for reviewing reports on the go

Table 2 - Persona 1 information

Biography

Helena is a Director of Operations of a mid-size company, responsible for overseeing multiple projects and teams. She makes sure that all departments contribute effectively to the company's financial performance.

Despite her experience and leadership skills, Helena feels restricted by the minimum number of tools that help her to monitor the financial performance of different teams, projects and partnerships, and simulate future investment scenarios. Keeping this in mind, she is in need of a data-driven solution that supports fast, confident decision-making to maximize profit and minimize operational waste.

Necessities

- Anticipate conflicts or productivity dips before they become critical issues
- Increase company profits while always taking into account the well-being of employees

Frustrations

- Limited visibility into the financial impact of daily operations.

Persona 2

Name	João Marques
Age	40
Education level	Masters in Industrial Engineering
Occupation	Project Manager
Family	Married
Location	Lisbon, Portugal
Technological proficiency	Average
Preferred devices	Smartphone for alerts, laptop for analysis

Table 3 - Persona 2 information

Biography

João has been responsible for managing cross-functional software development teams in a fast-paced tech company, for a decade.

He focuses on solving operational bottlenecks and ensuring that projects stay within budget, but constant changes in different variables such as resource allocation make this a daily challenge. João often struggles to translate raw productivity metrics into financial outcomes that his superiors can easily understand. He values tools that combine operational visibility with clear, data-backed profitability analysis.

Necessities

- Track real-time cost-to-profit ratios for active projects
- Communicate financial insights efficiently to executives

Frustrations

- Inconsistent reporting across teams
- Feeling reactive instead of proactive in budget control

Activity scenarios

Activity scenario 1

At the end of a busy day, Helena opens Growplify on her laptop to review the company's latest financial performance indicators. The dashboard presents detailed reports showing each department's productivity relative to its profit margin.

She immediately notices that the logistics team's labor costs have increased, reducing the overall margin of a major project. Using the AI-based simulator, Helena adjusts variables such as resource allocation and overtime expenses to explore potential outcomes. The mobile app shows that a small change in staffing and delivery routes could increase the project's profitability by 8%.

With this information, Helena exports the report and shares it with higher-level members through the mobile app's communication tool.

Activity scenario 2

It’s Thursday morning, and João receives a push notification from Growplify: “Warning – Project Orion’s cost-to-profit ratio has dropped by 12% this week.”

Opening the mobile app, João sees that freelance developer costs have surged due to unexpected overtime. He navigates to the AI Simulation panel and adjusts the variables - reducing external hours and redistributing internal resources. The system instantly recalculates projected margins, showing that by shifting two tasks in-house, the project’s profitability could recover to 9%.

Satisfied with the scenario, João exports an automated performance summary highlighting the corrective plan and sends it to his director through Growplify’s secure communication tool. Later that afternoon, he receives feedback approving the adjustments - all before the costs spiral further.

Through this quick, data-driven interaction, João prevents a potential financial setback while strengthening his case for smarter internal resource planning.

Functionalities

Individual and Team Profitability Analysis: Automatically discover if each employee, team, or department contributes to the company's profit or loss. It relates costs (labor, time, and resources spent) to the resulting revenue or financial value.

Project and Profit Monitoring: Allows to monitor the financial performance of each project in real time. Calculates costs, revenue, gross and net margins. Generates automatic alerts when a project approaches break-even. Displays historical profitability and profit growth by phase.

Profit Forecast and Investment Simulation: Uses AI to forecast how much profit can be expected based on the amount invested. Enables you to test “what if” scenarios — such as, “What would happen if we increased our investment into this project by 20%?”. Produces profit projection, return on investment and the payback period.

Automated Financial Performance Reports: Automatically generate reports with key information: net profit, return on investment, productivity/profit ratio, cost per employee, and more. Customized reports by team, project, or time period. Export to PDF, Excel, and interactive dashboards.

Partnership Management and Value Assessment: Analyzes the financial contribution of partners and suppliers. Identifies more profitable partnerships and alerts to those that reduce margins. Helps in decision-making about renewing, renegotiating, or terminating partnerships.

Intelligent Financial Dashboard: Central dashboard with a global view of the company's financial health. Displays profit by employee, project, and business unit. Includes growth trend indicators and automatic alerts for financial anomalies.

Smart Notifications: Automatic alerts about: Projects with lower-than-expected profits, employees with declining productivity, more profitable investment opportunities.

Phase II - Lo-fi Prototype and Heuristic Evaluation

Project Description

Growplify is a mobile application with the objective to help companies understand the financial impact of their operations and employees. The application uses artificial intelligence to create analyses showing whether employees, teams, or projects are generating profit for the company. From this, the application creates easy-to-understand reports that enable companies to focus on productivity and profitability, thus helping them understand areas where they can cut spending to boost profits.

The platform supports scenario modeling to assist in strategic decision-making. In other words, by manipulating different parameters of a given project, such as the number of employees and work hours per week, managers can see what the expected results are and make decisions to increase profitability.

Growplify also has features that evaluate the financial performance of partnerships, analysing each collaboration through its profit and rentability helping users to identify which can be harmful or not to the company.

Ultimately, Growplify allows companies to create value from financial data, ensuring that every operational decision and investment is used in a way to increase the value of the company.

In this second phase, we implemented three core functionalities defined in the User Analysis phase:

- Individual and team profitability analysis.
- Profit forecasting and investment simulation.
- Smart notifications.

The table below details these features and the specific user tasks designed to evaluate them in the prototype.

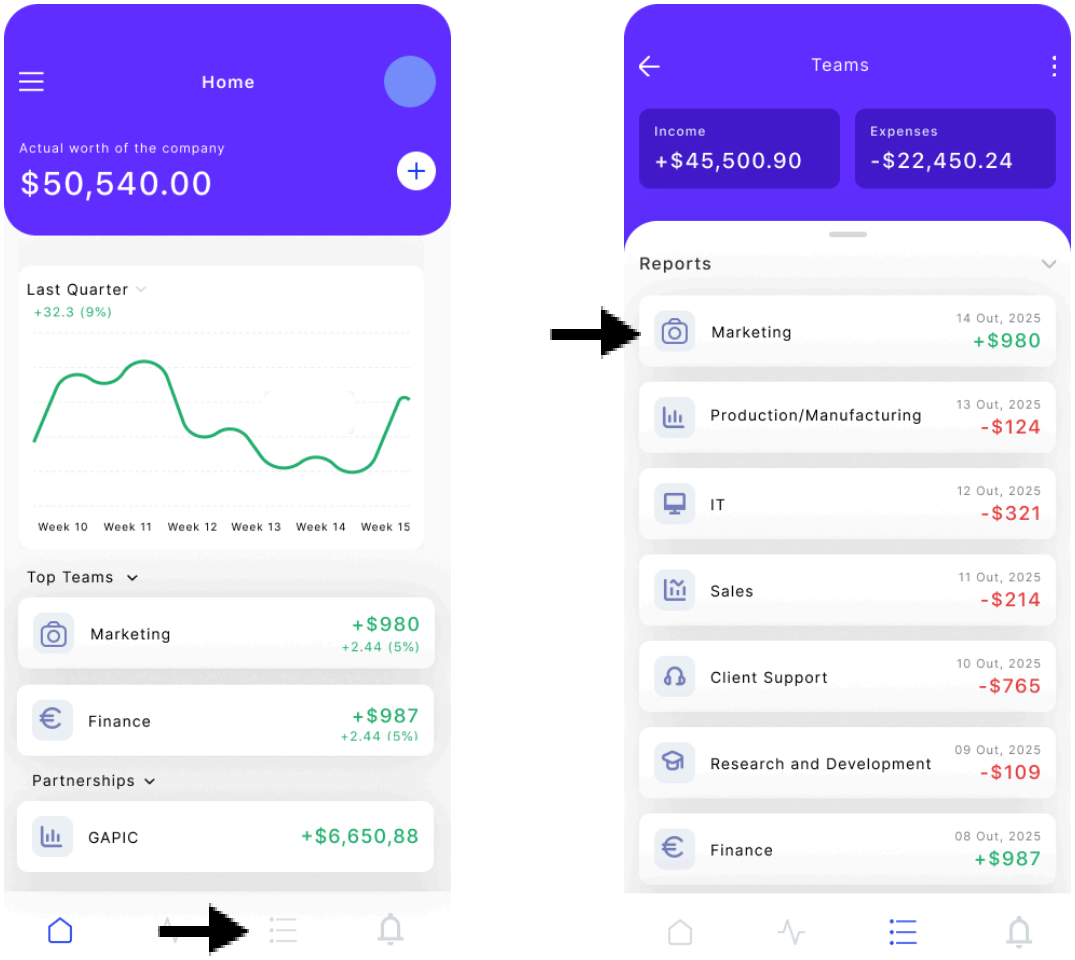
Feature	Description	Task
Individual and team profitability analysis	The user is able to select the team under analysis, as well as their members, to check the financial return, according to the allocated financial records.	I want to select the marketing team to see the financial return analysis according to the associated costs, and view the members individually.
Profit forecasting and investment simulation	The user is able to select a project and adjust project variables to instantly visualize impacts to projected profit.	I want to simulate the profit of the website development project by decreasing the time invested and increasing the number of workers.
Smart notifications	Automated, real time system that pushes notifications to users of alerts for critical deviations in financial projections, to prevent financial damage.	The marketing team's financial return fell by 8% last month, and therefore I want to receive a notification to alert me before it causes greater damage to the company.

Table 4 - Functionalities and task description

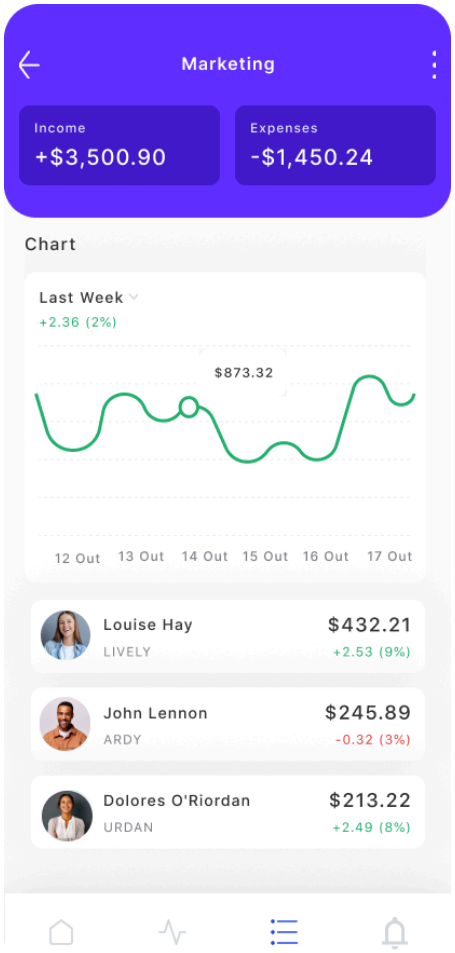
Prototype's Wireflow

Task 1 - Individual and team profitability analysis

When accessing the homepage, the user can click on the teams button to access a new page that lists different teams.

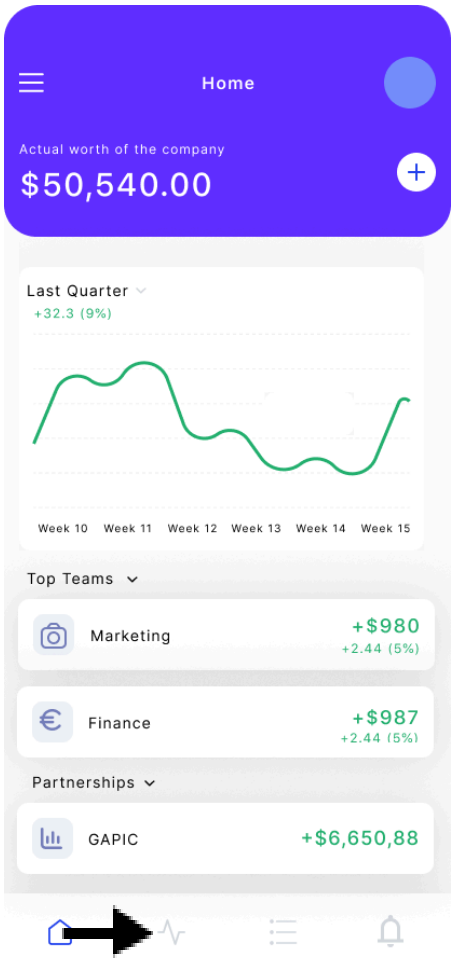


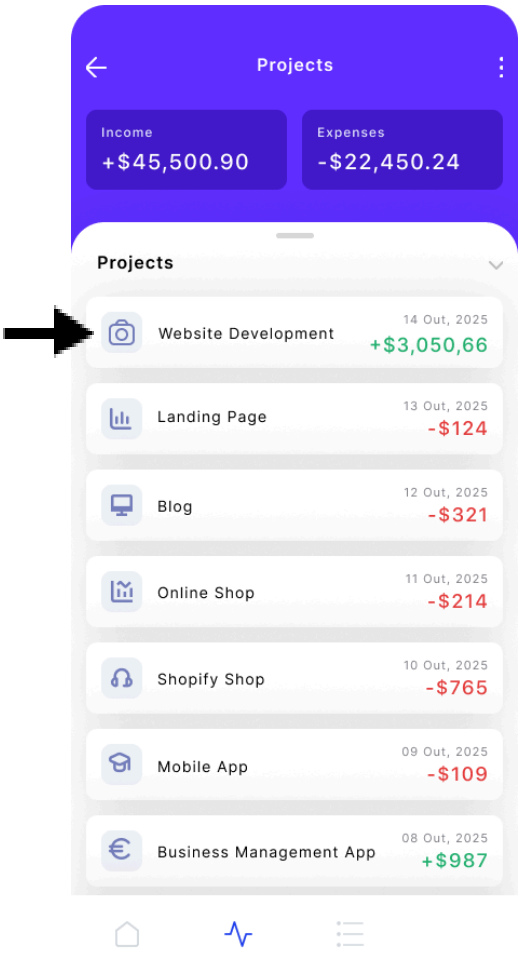
By selecting a specific team, the user will have access to the financial information of the team itself, as well as that of each of its members.



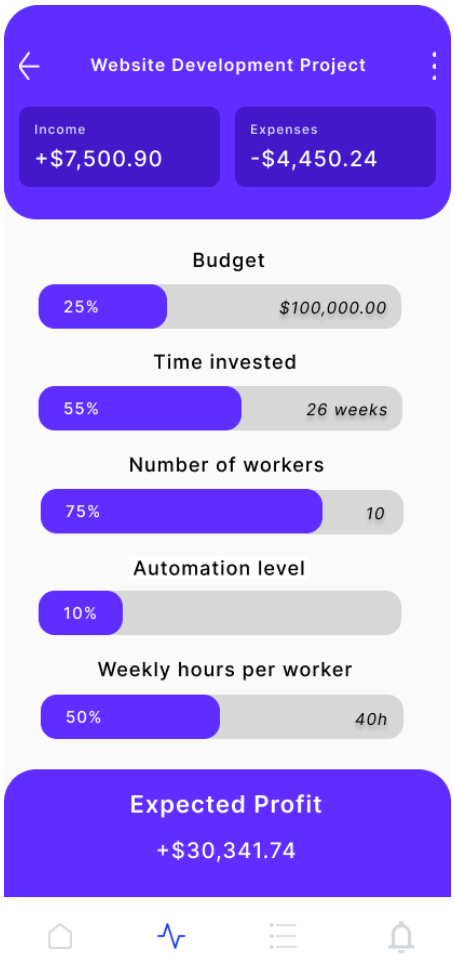
Task 2 - Profit forecasting and investment simulation

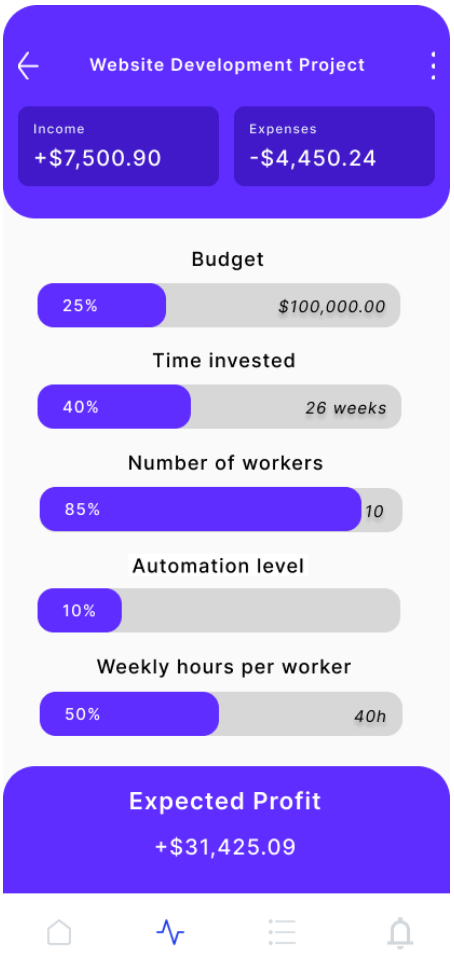
When accessing the homepage, the user can click on the projects button to access a new page that lists different projects.





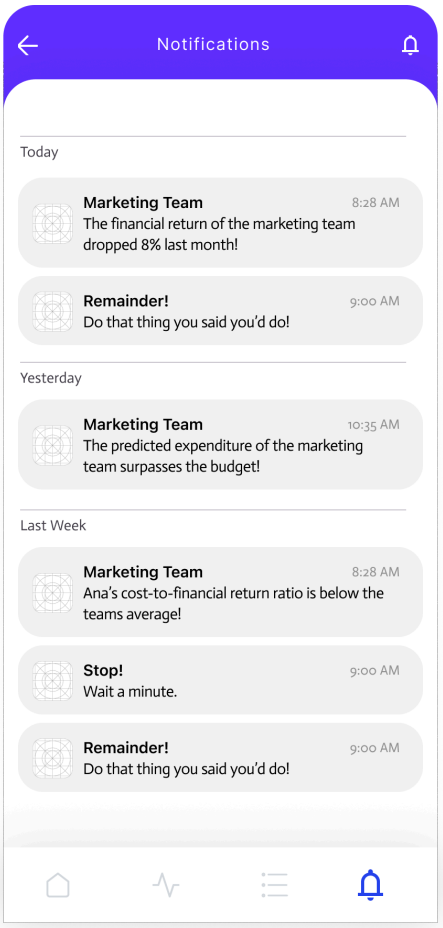
When selecting a specific project, the user will have access to a new page with different adjustable parameters. By modifying these parameters, the user can simulate investment scenarios, using artificial intelligence, to support strategic decisions.





Task 3 - Smart notifications

In a given situation, for example when the marketing team's financial return decreases by 8%, the user should receive a notification providing this information.



When selecting a notification, the user should be redirected to the notifications page where they can view them in more detail.

Digested Heuristic Evaluation Results

Taking into account the heuristic evaluation reports received, the following usability problems were identified:

Problem	Description	Heuristic	Severity
1	Graphs only show one value on the Y-axis, making it difficult to read values at other points. This makes comparing values difficult, which can lead to misinterpretations.	1	2
2	Project icons do not clearly represent the theme of the projects.	2	1
3	The user cannot manage notifications. The user may want to manage what they are notified about and when they receive it.	3	2
4	There is no help section, FAQ, or support. The lack of a dedicated space to help the user can lead to difficulties in using the system, especially for new or less experienced users.	10	1

Table 5 - Heuristic evaluation results

The discussion between the team over the identified heuristic evaluations received ended in the agreement that the feedback was non-exhaustive, occasionally focusing on the looks, which are not expected to be great in a low fidelity prototype.

Consequently, the team's attention shifted into performing our own critical analysis of the prototype, where we found a violation of the heuristic user control and freedom of severity 3:

On task 2, profit forecasting and investment simulation, the user has access to a screen where he is able to adjust parameters of a project's resource allocation, simulating different investment scenarios. However, it lacks the possibility to "reset" or "undo" the changes that have been made which limits the user and can even frustrate them when mistakes are made.

Corrections to perform in Phase 3

Problem	Solution
1	Add more values to the Y-axis of the chart to improve data readability. This improvement allows the user to read the graphs more accurately, making it easier to interpret the differences between points and understand the scale.
2	Change the project icons to better represent the project themes, making them easier to identify. This will improve navigation and make the interface more intuitive.
3	Add notification management with actions such as delete and mute. This will provide better management on the part of the user, who will gain autonomy.
4	Create a Help, FAQ, or documentation section to support users. This will improve the user's learning process and reduce the number of errors made.

Table 6 - Corrections proposed for phase 3

Phase III - Hi-fi prototype and user evaluation

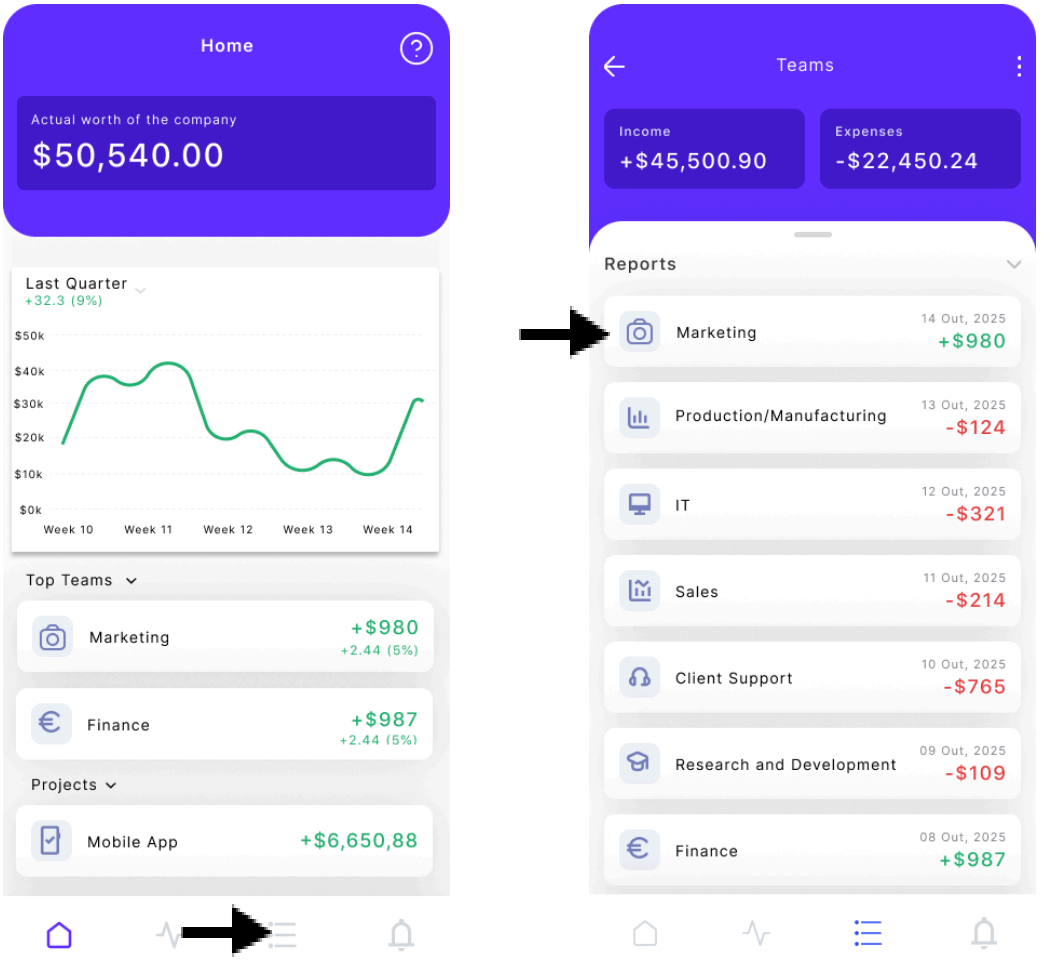
Changes to Parts I and II

After receiving feedback on the work done in phases 1 and 2 of our project, our group decided to initially focus on strengthening the main concepts behind our product, Growplify. With this in mind, regarding phase 1, we attempted to rewrite the text to better express the essential ideas of each topic, especially given the presence of previously generated AI content. In phase 2, our goal was to simplify the material across the different sections in order to ensure they were communicated more clearly and effectively.

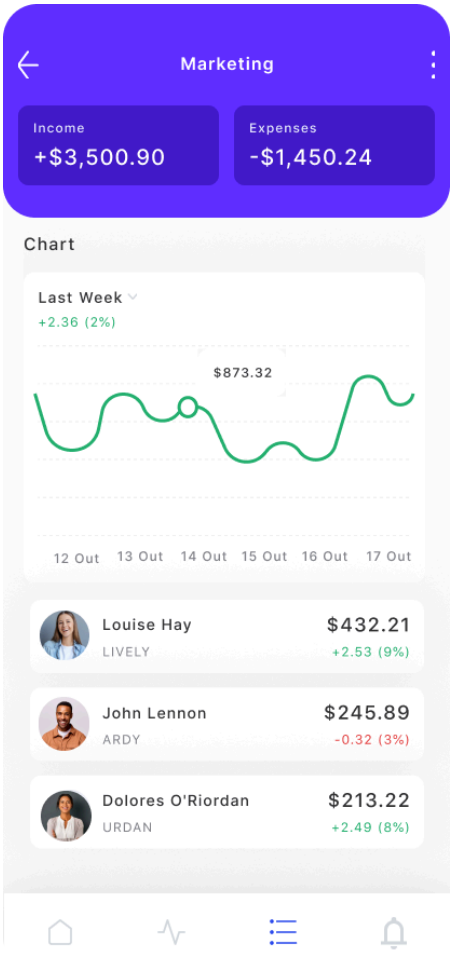
Prototype's Wireflow

Task 1 - Individual and team profitability analysis

When accessing the homepage, the user can click on the teams button to access a new page that lists different teams.

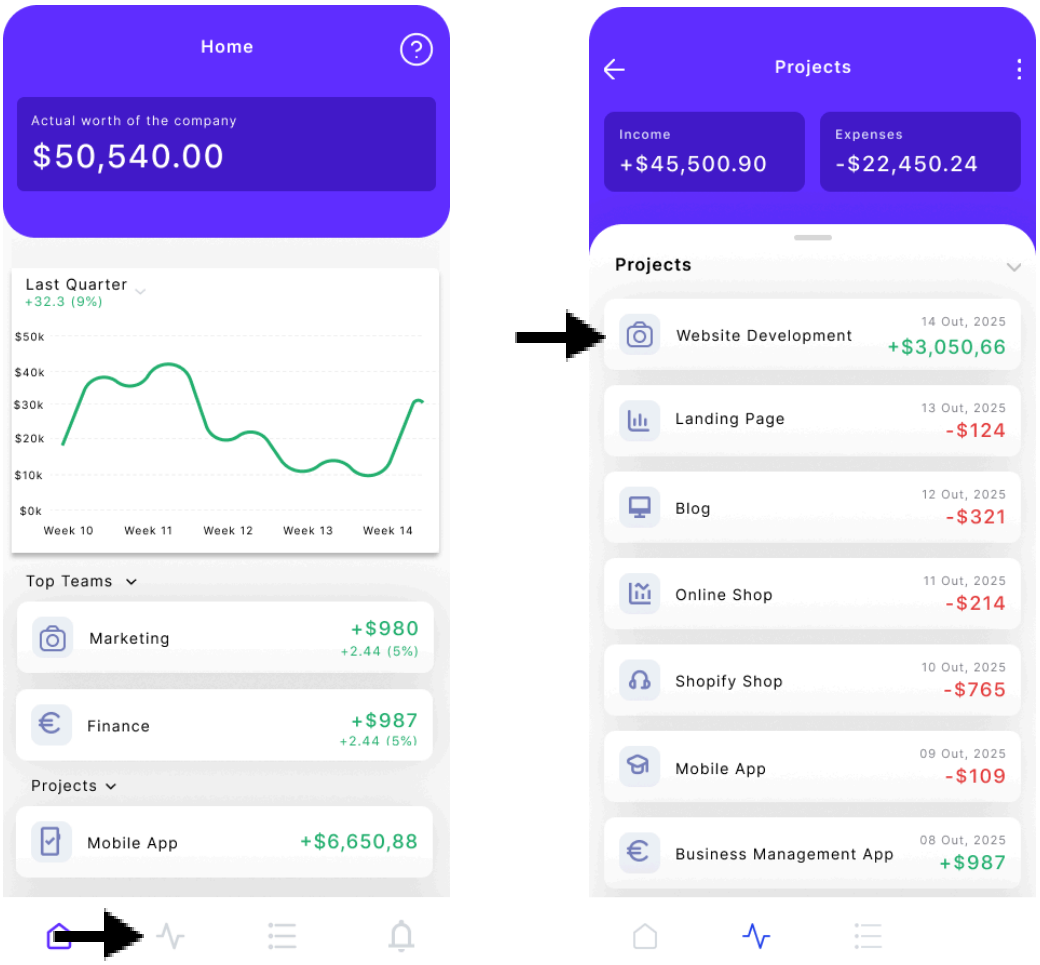


By selecting a specific team, the user will have access to the financial information of the team itself, as well as that of each of its members.

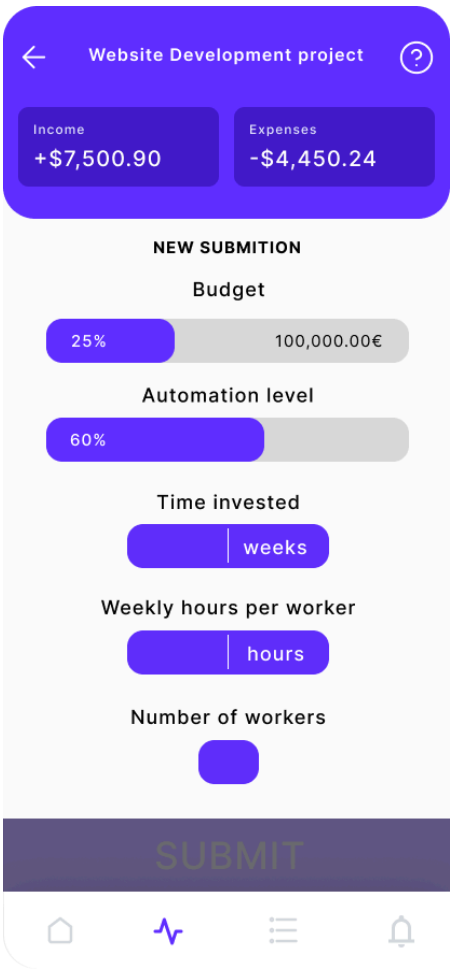


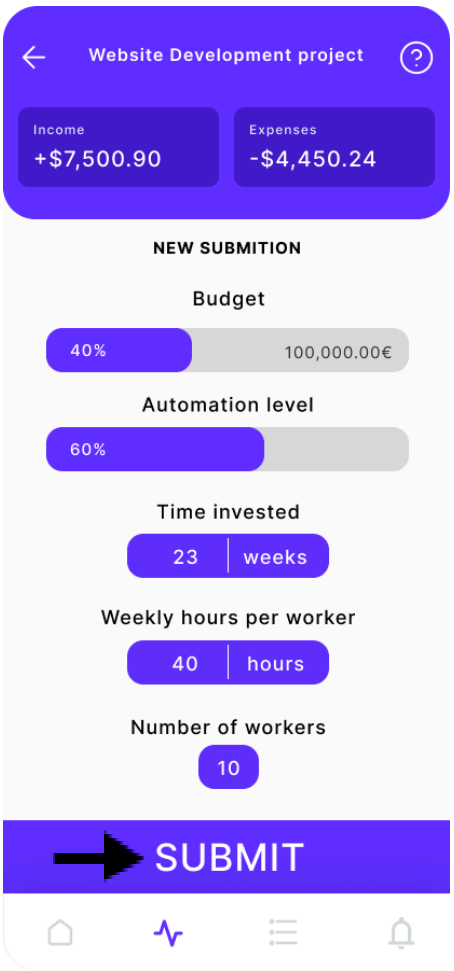
Task 2 - Profit forecasting and investment simulation

When accessing the homepage, the user can click on the projects button to access a new page that lists different projects.

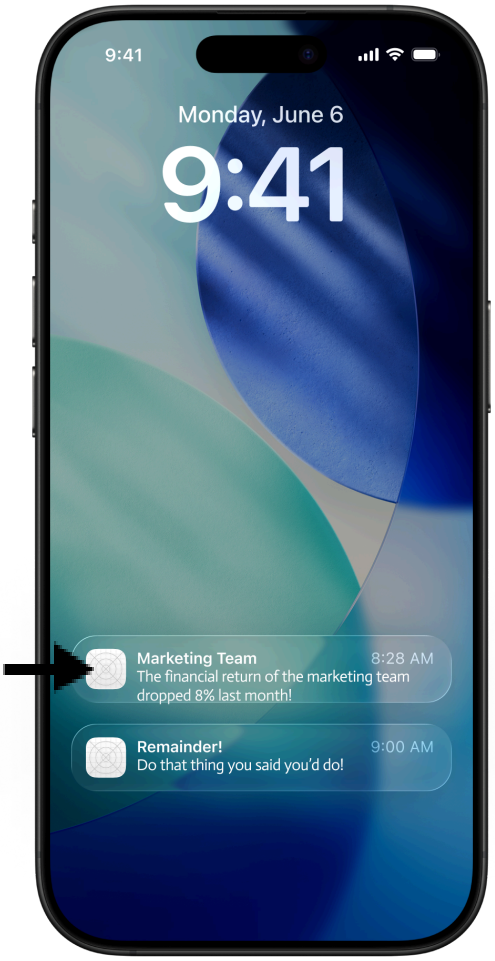


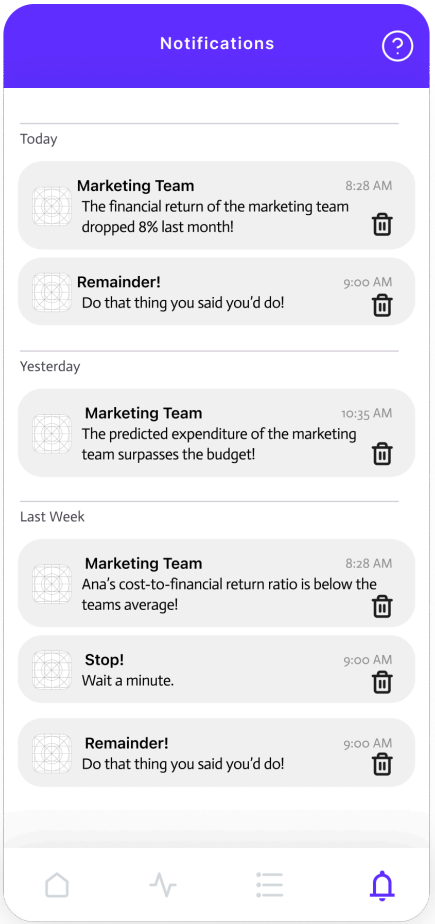
When selecting a specific project, the user will have access to a new page with different adjustable parameters.





By modifying these parameters, the user can simulate investment scenarios, using artificial intelligence, to support strategic decisions, by clicking in the submit button.





User evaluation protocol

Objective

This evaluation aims to understand users' reactions to our product, Growplify, across different aspects such as efficiency and usability while carrying out the proposed tasks.

The evaluation unfolds in three main stages. In the first approach, a brief presentation of the platform. In the second phase, users will be invited to perform three of the tasks implemented in the application, some quantitative data will be extracted, such as the total time to complete the task, the number of errors made during the attempt, and the number of clicks on the interface. In the last part, users will complete a global satisfaction survey.

Users

The sample of users invited to participate in the platform evaluation session should be representative of the study population. Therefore, individuals who hold management positions in companies or who are in the initial stages of creating a company, aged between 23 and 51 years old, will be selected.

All of them agreed to participate voluntarily, and we asked them to be honest with their evaluation.

Method

1. Initially, a brief presentation of the application's objective and context was given, followed by a demonstration of the help page to illustrate the main functionalities.
2. Invitation to perform task 1 - Verify the financial return of a team and its members. At that moment, the platform's effectiveness and efficiency parameters will be evaluated through the quantification of the total number of clicks on the interface, the number of errors throughout the task, and the total execution time.
3. Invitation to complete task 2 - Select a project and use the AI tool to calculate profit in different investment scenarios. At this point, the platform's effectiveness and efficiency parameters will be evaluated by quantifying the total number of clicks on the interface, the number of errors throughout the task, and the total execution time.
4. Invitation to complete task 3 - Select a notification. At this time, the platform's effectiveness and efficiency parameters will be evaluated by quantifying the total number of clicks on the interface, the number of errors throughout the task, and the total execution time.

5. Invitation to complete the satisfaction survey about the platform and methods adopted. This allows us to qualitatively extract the user's perception of the interface used.

Tasks

Task 1 - Verify the financial return of a team and its members

Description

In this task, we propose that the user select the Marketing team from the application's teams page. Before executing the task, the platform should display the home page.

Measurements

During the execution of the proposed task, three parameters will be measured quantitatively:

- Total time to complete the task, in seconds;
- Number of errors made.
- Total number of clicks on the interface;

These parameters are necessary to evaluate the effectiveness and efficiency of the interface in this requirement. Satisfaction will be assessed during the completion of the individual questionnaire at the end of the session.

Task 2 - Select a project and use the AI tool to calculate profit in different investment scenarios

Description

In this task, we propose that the user select the Website Development project from the application's project page. Before executing the task, the platform should display the home page.

Measurements

During the execution of the proposed task, three parameters will be measured quantitatively:

- Total time to complete the task, in seconds;
- Number of errors made.
- Total number of clicks on the interface;

These parameters are necessary to evaluate the effectiveness and efficiency of the interface in this requirement. Satisfaction will be assessed during the completion of the individual questionnaire at the end of the session.

Task 3 - Select a project and use the AI tool to calculate profit in different investment scenarios

Description

In this task, we propose that the user select a notification. Before executing the task, the platform should display the lockscreen.

Measurements

During the execution of the proposed task, three parameters will be measured quantitatively:

- Total time to complete the task, in seconds;
- Number of errors made.
- Total number of clicks on the interface;

These parameters are necessary to evaluate the effectiveness and efficiency of the interface in this requirement. Satisfaction will be assessed during the completion of the individual questionnaire at the end of the session.

Satisfaction questionnaire

In order to evaluate qualitative and subjective aspects of the platform, both globally and for each task, users will be invited at the end of the session to answer a brief satisfaction questionnaire. This questionnaire includes questions that assess the user's perception of the usability and relevance of the application, as well as the clarity of each implemented functionality.

Results and statistical analysis

Sample characterization

The sample of users who participated in the evaluation is representative of potential users of our application. Ten participants were selected who hold management positions in companies or who are in the initial stages of creating a company, with ages ranging from 23 to 51.

All of them agreed to participate voluntarily, and we asked them to be honest with their evaluation.

Statistical analysis

Task 1 - Results

User	Time in seconds	Total number of clicks	Number of errors
1	25.2	2	0
2	10.0	2	0
3	31.6	3	1
4	14.1	2	0
5	26.2	2	0
6	11.3	2	0
7	33.2	4	2
8	17.5	2	0
9	24.1	3	1
10	9.4	2	0

Table 7 - Task 1 quantitative results

User	Relevance in the context of the platform	Complexity	Intuitividade	Presentation
1	Very High	Very High	Very High	Very High
2	Very High	Very High	Very High	Very High
3	Very High	Very High	Very High	Very High
4	Very High	Very High	Very High	Very High
5	Very High	Very High	High	High
6	Very High	Very High	Very High	Very High
7	Very High	Very High	High	High
8	Very High	Very High	High	High
9	Very High	Very High	Very High	Very High
10	Very High	Very High	Very High	Very High

Table 8 - Task 1 qualitative results

Task 1 - Statistical Analysis

For the statistical analysis of the quantitative data collected from task 1, we used the confidence interval metric because it allows us to compare the data obtained with the pre-established requirements when developing the high-fidelity prototype. We set a confidence level of 95% (alpha = 0.05) for all variables.

The average total task execution time calculated was 20.26 seconds. This triggered the confidence interval [13.86 ; 26.66], and since the expected value of 30 seconds is not within the interval, we cannot state with 95% confidence that the time is less than expected.

On average, users made fewer clicks (2.4) and errors (0.4) than expected, and more than half of them did not make any errors in the smooth execution of the task. According to the calculated intervals [1.90 ; 2.90] and [0.00, 0.90] and the reference values of 3 clicks and 1 error, respectively, there is a 95% confidence level of proven effectiveness for both parameters.

The analysis of the collected qualitative ordinal data revealed that the task is very simple, very intuitive, with an excellent visual presentation and very relevant to the application.

Task 2 - Results

User	Time in seconds	Total number of clicks	Number of errors
1	42.3	7	2
2	28.1	5	0
3	56.7	9	4
4	37.5	6	1
5	45.9	8	3
6	31.2	5	0
7	62.4	10	5
8	33.8	6	1
9	49.1	8	3
10	26.5	5	0

Table 9 - Task 2 quantitative results

User	Relevance in the context of the platform	Complexity	Intuitividade	Presentation
1	High	Moderate	Moderate	Moderate
2	Very High	High	Very High	Very High
3	High	Low	Moderate	Moderate
4	Very High	Moderate	High	High
5	Very High	Moderate	Moderate	High
6	Very High	High	Very High	High
7	High	Low	Moderate	Moderate
8	Very High	Moderate	Very High	High
9	Very High	Low	Moderate	Moderate
10	Very High	High	Very High	Very High

Table 10 - Task 2 qualitative results

Task 2 - Statistical Analysis

For the statistical analysis of the quantitative data collected from task 1, we used the confidence interval metric because it allows us to compare the data obtained with the pre-established requirements when developing the high-fidelity prototype. We set a confidence level of 95% (alpha = 0.05) for all variables.

The average total task execution time calculated was 41.35 seconds. This triggered the confidence interval [32.82 ; 49.88], and since the expected value of 50 seconds is not within the interval, we can state with 95% confidence that the time is less than expected.

On average, users made fewer clicks (6.9) and errors (1.9) than expected in the smooth execution of the task. According to the calculated intervals [5.62, 8.18] and [0.62, 3.18] and the reference values of 8 clicks and 3 errors, respectively, there is not enough statistical evidence to state this with 95% confidence.

The analysis of the collected qualitative ordinal data revealed that the task has medium complexity, intermediate intuitiveness, good visual presentation and is very relevant to the application.

Task 3 - Results

User	Time in seconds	Total number of clicks	Number of errors
1	8.9	2	0
2	10.1	2	0
3	9.4	2	0
4	11.2	3	0
5	8.7	2	0
6	9.1	2	0
7	10.3	3	1
8	8.5	2	0
9	9.0	2	0
10	9.4	2	0

Table 11 - Task 3 quantitative results

User	Relevance in the context of the platform	Complexity	Intuitividade	Presentation
1	High	Very High	Very High	Very High
2	Very High	Very High	Very High	Very High
3	Very High	Very High	Very High	Very High
4	High	Very High	Very High	Very High
5	High	Very High	Very High	Very High
6	Very High	Very High	Very High	Very High
7	High	Very High	Very High	Very High
8	Very High	Very High	Very High	Very High
9	High	Very High	Very High	Very High
10	High	Very High	Very High	Very High

Table 12 - Task 3 qualitative results

Task 3 - Statistical Analysis

For the statistical analysis of the quantitative data collected from task 1, we used the confidence interval metric because it allows us to compare the data obtained with the pre-established requirements when developing the high-fidelity prototype. We set a confidence level of 95% (alpha = 0.05) for all variables.

The average total task execution time calculated was 9.37 seconds. This triggered the confidence interval [7.58, 11.16], and since the expected value of 20 seconds is not within the interval, we can state with 95% confidence that the time is less than expected.

On average, users made fewer clicks (2.1) and errors (0.1) than expected in the smooth execution of the task. According to the calculated intervals [1.87, 2.33] and [0.00, 0.33] and the reference values of 3 clicks and 1 error, respectively, we can state with 95% confidence that both metrics are significantly lower than expected.

The analysis of the collected qualitative ordinal data revealed that the task is very simple, very intuitive, with a very good visual presentation and relevant to the application.

Global Assessment - Results

User	The experience of using the platform was pleasant.	I felt there were unnecessarily complex elements.	I find the system to be simple to use.	I feel I would need external support to use this application.
1	Totally agree	Totally disagree	Totally agree	Totally disagree
2	Agree	Disagree	Totally agree	Disagree
3	Totally agree	Totally disagree	Totally agree	Totally disagree
4	Agree	Totally disagree	Totally agree	Totally disagree
5	Agree	Disagree	Totally agree	Disagree
6	Totally agree	Disagree	Totally agree	Disagree
7	Totally agree	Totally disagree	Totally agree	Disagree
8	Totally agree	Disagree	Totally agree	Disagree
9	Totally agree	Totally disagree	Totally agree	Totally disagree
10	Totally agree	Disagree	Agree	Neither agree nor disagree.

Table 13 - Part 1 of global assessment results

User	I noticed that the system's functionalities are well integrated with each other.	I felt confident using the application.	I feel that some prior knowledge would be necessary to use the application.
1	Totally agree	Totally agree	Totally disagree
2	Agree	Totally agree	Disagree
3	Totally agree	Totally agree	Totally disagree
4	Agree	Totally agree	Totally disagree
5	Totally agree	Totally agree	Disagree
6	Totally agree	Agree	Neither agree nor disagree.
7	Totally agree	Totally agree	Totally disagree
8	Totally agree	Totally agree	Disagree
9	Totally agree	Totally agree	Totally disagree
10	Totally agree	Totally agree	Disagree

Table 14 - Part 2 of global assessment results

Global Assessment - Statistical Analysis

The satisfaction questionnaire presented to users in the final stage, in addition to helping with the individual subjective evaluation of each task, included a global evaluation of the developed application. This part of the questionnaire resulted in ordinal qualitative data (from "Totally disagree" to "Totally agree").

The vast majority of users enjoyed using the application, finding it easy to use, without unnecessary complexity, and with well-implemented functionalities. It is important to highlight that none of the users mentioned that they would need any type of external support to continue using the platform.

The overall level of satisfaction with the implemented functionalities and the overall aspect is quite high.

Conclusions

The development of this project within the Human-Computer Interaction course allowed us to apply and consolidate theoretical knowledge in a practical context, through the design, prototyping, and evaluation of the interface of an application for business financial management.

The first step was to define the concept, followed by the user analysis in order to ensure that the proposed interface met the real needs of target users. The prototyping phase evolved from a low-fidelity prototype to a more visually appealing high-fidelity prototype, implemented through the visual and collaborative design tool Figma.

The user evaluation phase was very important, where we tested our application with 10 potential users who represented our target audience. The analysis of the quantitative and qualitative data collected through different evaluation methods, allowed us to calculate the effectiveness, efficiency, and satisfaction of our prototype and identify possible areas for improvement.

This project allowed us to try out the different topics covered in the theoretical classes, such as PACT analysis, heuristic evaluation, and usability testing. It helped us understand the importance of making decisions based on feedback and translating our ideas into prototypes.

In short, the Growplify project served as a continuous learning experience that allowed us to simulate the design of an application and consolidate important technical, analytical, and collaborative concepts for future projects involving user experience design.
